

Retired Academy visualization

This document archives the **legacy Three.js network scene** that previously rendered in JRP Academy lessons 1–8.

Status: **retired from the Academy**. The live Academy uses the entity renderer in `src/academy/pipeline/entities.ts` (people, vault, loan-broker building, contracts, coins).

What the legacy scene showed

```
Depositor  = green sphere
Borrower   = orange cylinder / cone
Vault      = blue box + torus ring
Protocol   = indigo octahedron
Links      = TubeGeometry pipes with pulsing spheres
```

Why it was replaced

Learners had to interpret abstract geometry. The intended visual language is:

- Administrator, Depositor, Borrower = people
- Lending Vault = recognizable vault
- Loan Broker / Protocol = office / operating entity
- Rules and loan terms = documents
- Capital = coins / share tokens traveling along floor paths

Where it lived

Class `LendingNetworkScene` in `src/academy/pipeline/LendingNetworkScene.ts` used a local `createNode()` helper (`SphereGeometry`, `OctahedronGeometry`, `BoxGeometry`, `CylinderGeometry`) and `TubeGeometry` pipes. A parallel entity implementation already existed in `entities.ts` but was never imported — that was the root cause of the wrong scene.

Canonical renderer now

Academy → `LendingPipelineCanvas` → `SceneMount` → `LendingNetworkScene` builds the world from `createPerson`, `createVault`, `createProtocolHub`, `createContractStand`, and `createCoin`. Lesson index only changes camera focus and which props are visible. Lesson 8 uses the same world.
